

Outbreaks disrupt routine immunisation (RI)

Provisional recommendations-1

1. Routine immunization services should continue countrywide with preferential use of smaller less crowded levels 2 and 3 facilities to reduce exposure of children and care givers
2. High volume health facilities should also continue routine immunization. To minimize risk These facilities should set up separate space akin to an out-reach post service
3. As much as possible mothers should be given specific scheduled appointments for routine immunization
4. Infants and caregivers coming for immunization services should be triaged for possible Exposure and appropriately directed to a point of care
